

mriia

An agentic operations platform for the clinics that keep Canadian healthcare running.

THE PROBLEM

Clinical teams spend as much energy on paperwork as on patients

Fragmented tools

Referrals, intake, scheduling, billing and documentation live in systems that don't talk to each other.

Source: mriia competitive research, Sept 2026

Manual handoffs

Staff re-key the same patient information across the EMR, billing, and referral portals by hand.

AI bolted on, not built in

Most platforms offer AI as an add-on feature, announced long before it's something a clinic can run on.

POSITIONING

mriia is the agentic operations layer clinics run on — not another EMR to fight with, not a point solution that automates one task.

One foundation. Four products. Built for how Canadian clinics actually work.

One foundation, four products

Tenant isolation isn't a feature — it's the foundation

One vault per tenant

Every organization's data carries its own encryption and is isolated at the tenant level — one clinic's data cannot leak into another's.

Lightweight for solo practitioners

Independent practitioners get a personal space with no data-storage burden of their own — just the tools and subscriptions they need.

One AI harness, tenant by tenant

The same AI harness that onboards every customer through RUTA also orchestrates and secures each tenant's environment.

VALUE PROPOSITIONS

Four experiences, one platform

Document management that doesn't suck

A native system for clinical and administrative documents that is genuinely easy to use.

An admin experience people don't dread

The paperwork side of running a clinic, redesigned around the people who do it every day.

A medical team experience built for clinicians

WORKSPACE gives clinical staff a tool built around how they work, not around the record system.

An operations experience that runs itself

RADA keeps the enterprise team's day-to-day operations moving without constant manual oversight.

CUSTOMER SEGMENTS

Four ways to buy in, one platform underneath

Segment	Entry point	What they get
Builders (health-tech startups)	RUTA & onward	Run virtual clinics on our API — we host all the infrastructure.
Enterprise platform partners	RADA & onward	Take the Foundation and self-host; buy support from us — our biggest accounts.
Medical clinics	RADA & onward	Buy the experience, not the technology — can run it under their own brand.
Independent practitioners	RADA & onward	Single-user, subscription pricing; bring your own tools, optionally.

Plus one segment that never pays a seat cost: clinical staff inside big clinics work in WORKSPACE every day.

BUSINESS MODEL

How the relationship — and the revenue — works

Customer relationship

Enterprise accounts: an account manager leads the relationship.

Clinics & practitioners: subscription-based, with customer service and no account management overhead.

Revenue streams

- Technology purchase & onboarding fee for enterprises
- Monthly / yearly subscription, tiered
- Ongoing support for enterprises

Cost structure

- Team
- Technology (LLMs & infrastructure)
- Marketing

PART TWO

The competitive landscape

22 companies benchmarked, from developer infrastructure to global EMR incumbents — and where none of them do what mriia does.

Six kinds of competitor, one Canadian gap

Developer infrastructure

Medplum · Canvas Medical

Powerful building blocks — you still build and operate the workflow.

Care orchestration

Awell · OceanMD

Coordinates referrals and workflows, but isn't a full clinic operating system.

Practice management & EHR

Healthie · Jane · Elation · Accuro/QHR

Ready operational platforms — not agentic, and not built around AI.

AI point agents

Phelix AI · Cortico · Notable · Commure

Automate one task well — not the whole back office.

Canadian EMR incumbents

TELUS Health · OSCAR Pro · MEDFAR/MYLE

Own the install base — and are the slowest to rebuild around agentic AI.

Global enterprise & adjacent

Epic · athenahealth · Tebra · Fabric · Innovaccer

Global scale — Canadian workflows and provincial billing aren't their focus.

None of the six groups combines Canadian-ready deployment with agentic AI.

POSITIONING

Ready to run and AI-native — nobody else is both

MORE TO BUILD

Build it yourself

Medplum · Canvas Medical — powerful infrastructure, but you assemble the workflow and the AI.

AI, but one task only

Phelix AI · Cortico · Notable · Commure · Innovaccer — useful point agents, not a full clinic operating system.

mriia's thesis, benchmarked against 22 vendors' public positioning

READY TO RUN

Ready, but not agentic

TELUS Health · Accuro/QHR · OSCAR Pro · Epic · athenahealth · Tebra · Elation — mature, thin on native AI.

YOU ARE HERE

mriia — ready to run, and agentic

One foundation your team can operate from day one, with AI built into every layer — not bolted on.

What the research actually found

Competitor	Category	Documented gap	mriia's angle
Medplum	Dev infrastructure	Gives you APIs and building blocks — you still configure, build and maintain the workflow.	We ship the workflow already built, with implementation support included.
TELUS Health	Canadian incumbent	Cross-EMR orchestration and AI features are announced, not yet generally available.	Agentic automation is native on day one, not a roadmap item.
Phelix AI	AI point agent	Automates referral intake well — doesn't extend to the rest of clinic operations.	One foundation runs referrals, documentation, billing coordination and more.
Zus Health	Interoperability	Aggregates patient data — but isn't a complete clinic operating system.	We turn that external data into a governed, run-the-clinic workflow.
Epic	Enterprise incumbent	Comprehensive care records — but an exceptionally demanding implementation to adopt.	A lighter path for the clinics that will never become an Epic account.

WHY CANADA IS THE WEDGE

Built where most of the field wasn't

US-first platforms haven't landed here

athenahealth, Tebra, Elation, Epic, Zus, Fabric, Innovaccer, Commure and Notable haven't established Canadian provincial billing or connectivity.

Canadian incumbents are the least likely to move

TELUS Health, Accuro/QHR, OSCAR Pro and MEDFAR/MYLE own the install base — and have the least incentive to rebuild around agentic AI.

mriia is built for the gap between them

Provincial billing, Canadian data residency, and agentic AI — designed together from the first line of code.

How mriia builds, and how it grows

ROLLOUT

Enterprise integration

Lands the platform inside a real clinic and keeps funding RUTA — and everything built on top of it.

Non-dilutive funding

Canadian R&D grants (e.g. SR&ED) extend runway alongside enterprise revenue.
